ITA0312-MOBILE COMPUTING

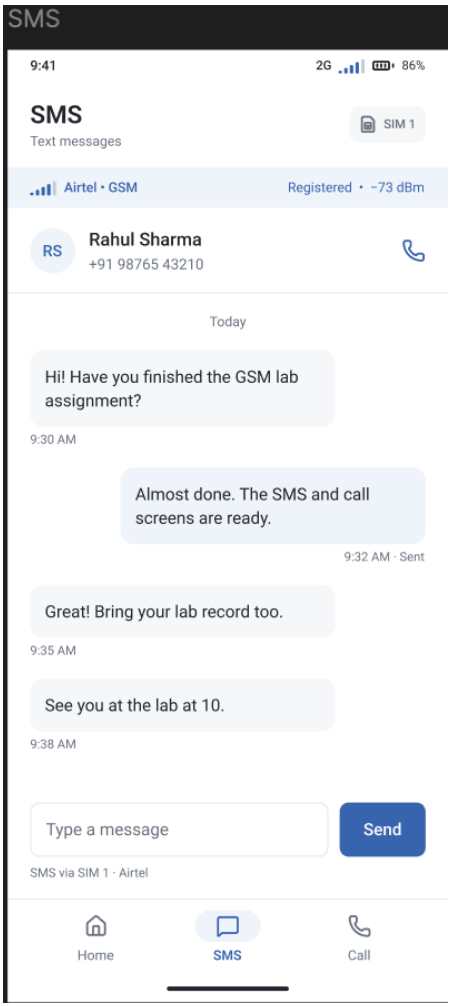

EXPERIMENT 9

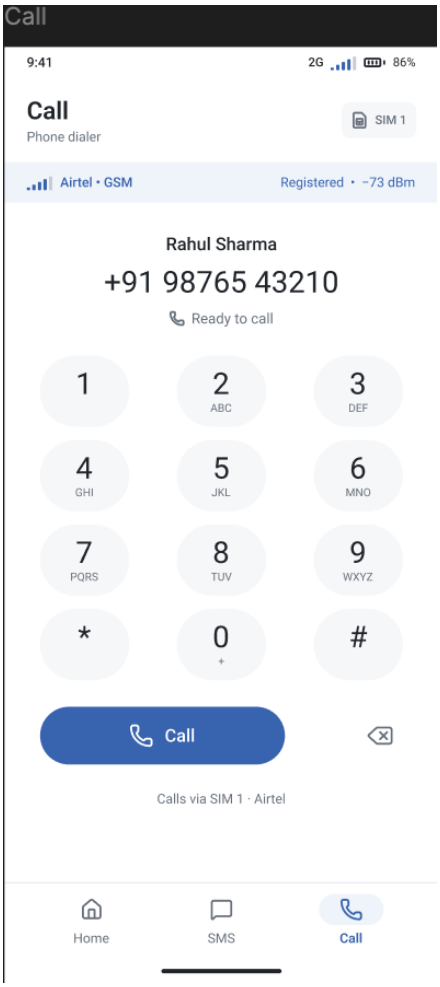

Aim: To develop a user interface prototype for a GSM service using Figma.

Procedure:

1. Create a mobile frame in Figma.
2. Design screens for calls, SMS, contacts, and network status.
3. Add buttons and navigation between screens.
4. Test the prototype and save it.

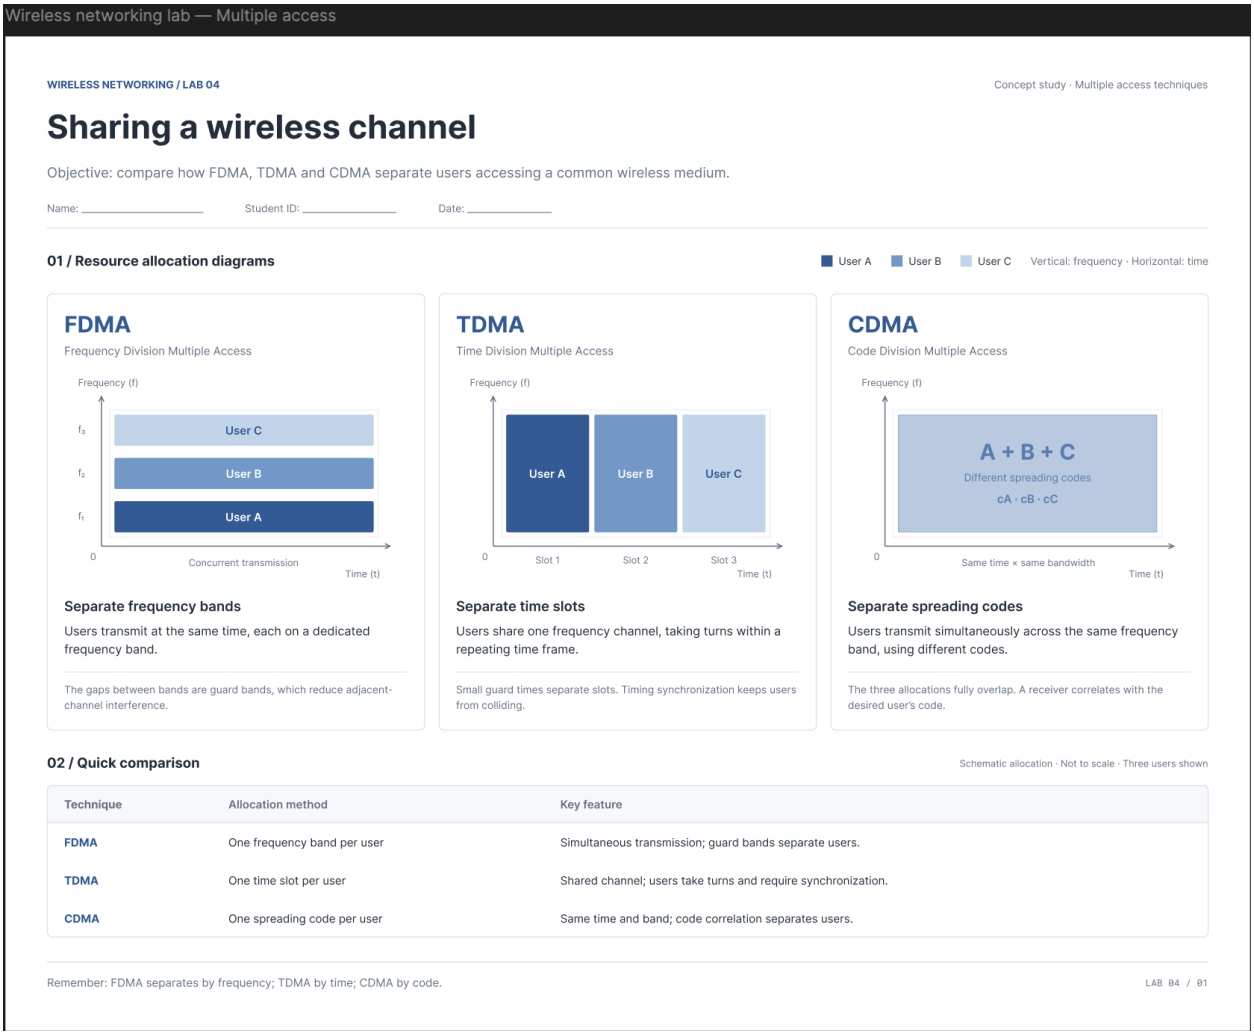

Result: A visual comparison of FDMA, TDMA, and CDMA techniques was created using Figma.

EXPERIMENT 10

Aim: To create a visual representation in Figma comparing different multiple access techniques.

Procedure:

1. Create a new frame in Figma.
2. Illustrate FDMA, TDMA, and CDMA using simple diagrams.
3. Add labels explaining frequency, time, and code allocation.
4. Arrange the diagrams and save the design.

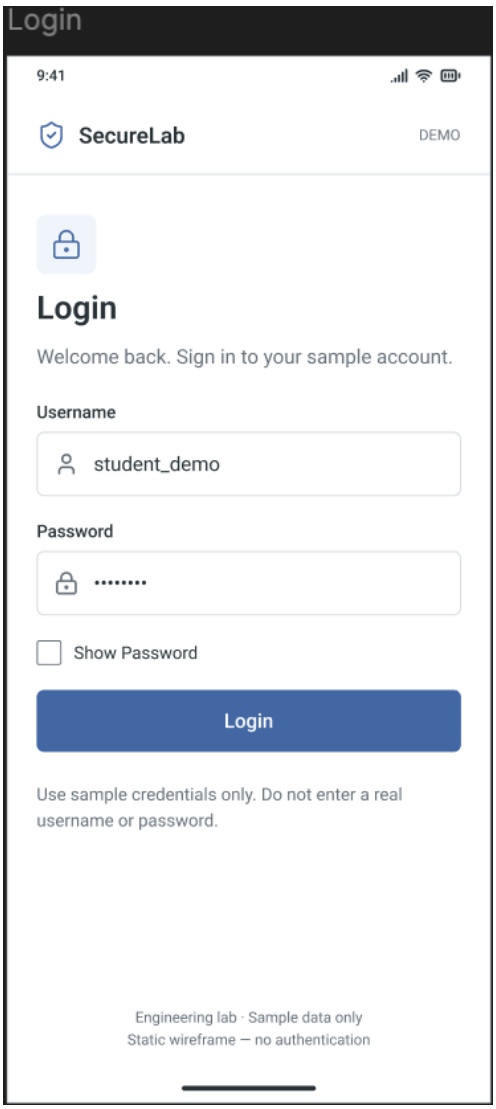

Result: A visual comparison of FDMA, TDMA, and CDMA techniques was created using Figma.

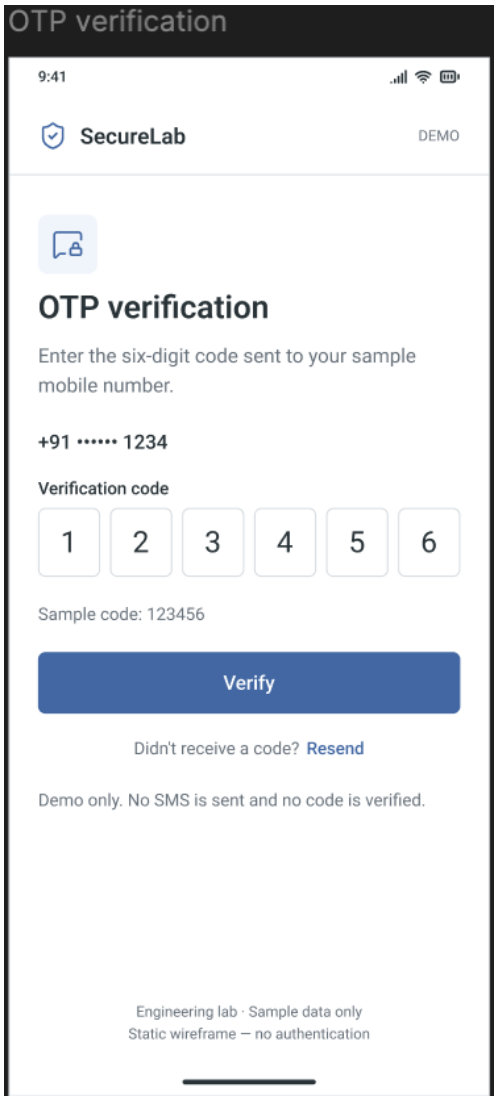

EXPERIMENT 11

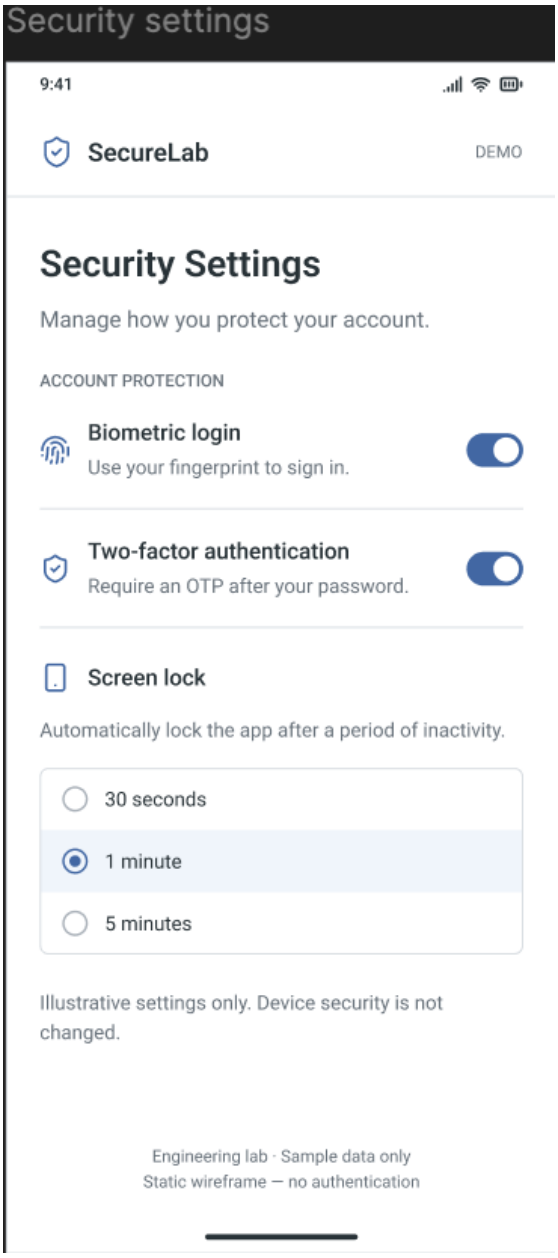

Aim: To design a mobile application wireframe incorporating essential security measures using Figma.

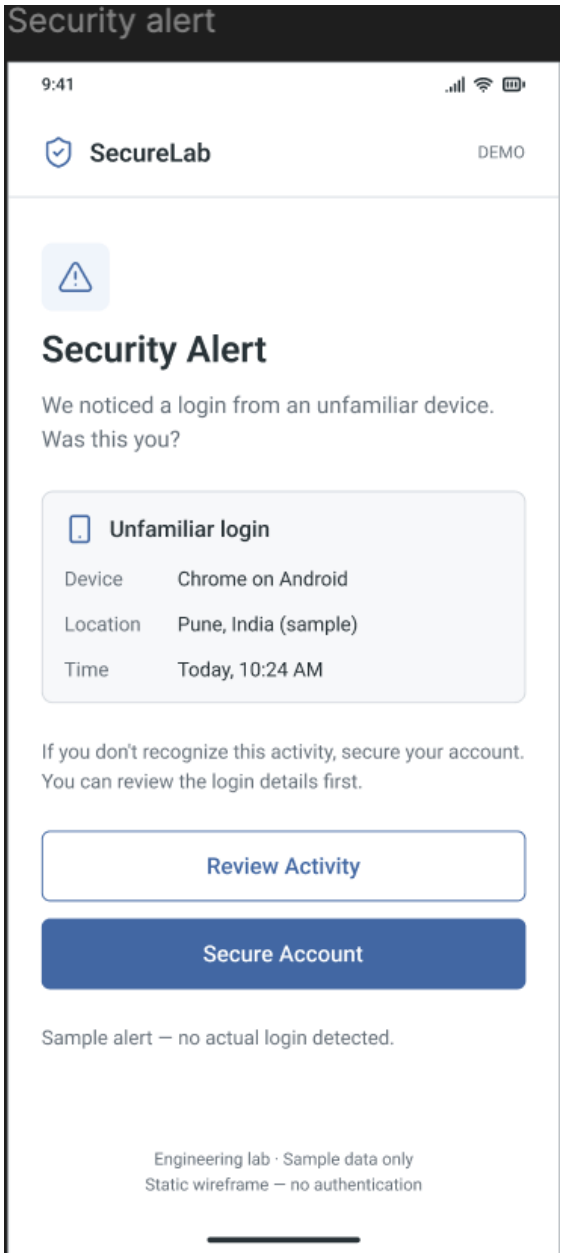

Procedure:

1. Create mobile-sized frames in Figma.
2. Design login, verification, and security settings screens.
3. Add password fields, OTP verification, and biometric authentication options.
4. Connect the screens and save the design.

Result: A mobile application wireframe incorporating basic security features was designed using Figma.
